

Qimma

AI growth for local businesses that want real leads

One-pager: problem, beachhead, solution, feasibility & how it works

1. Beachhead problem (the first fire we put out)

Local service businesses lose ready-to-buy customers because WhatsApp enquiries go unanswered (especially after hours) while their Google Business Profile is too weak to win "near me" searches.

That is the beachhead - not "all of marketing." We start here because the pain is sharp and frequent (a 9 pm message becomes a lost job), the buyer is clear (owner/ops of a salon, clinic, bakery, or interior studio), and today's tech can fix it (WhatsApp AI + Google Business agents).

One line: Stop losing serious local leads that already messaged you - and make Maps stop hiding you.

2. The wider problem

Local businesses lose work every day - not because their service is bad, but because marketing breaks in three places:

- Google Maps can't see them - outdated profiles, no posts, weak photos/reviews. Neighbours with worse work show up first.

In short: good businesses lose demand in the gaps - between search, reply, and follow-up.

3. Our solution

Qimma is an AI growth system for local businesses. One place connects Google Business Profile and WhatsApp. Then a small set of AI agents do the repeating work. The owner stays in control - agents draft and act; the business can approve what goes out.

Agent	Job
Scout	Finds what people search in your city
Sage	Improves Maps ranking and profile health
Spark	Writes and publishes Google posts
Maya	Answers WhatsApp fast and checks if the lead is serious
Ruby	Asks for reviews and helps reply
Cleo	Gives a simple monthly scorecard

How it works in four steps: Connect -> Activate agents -> Measure leads & rankings -> Grow with a clear scorecard.

4. Is this feasible today?

Yes. The tech is ready now. We do not need to invent something new - we need to stitch trusted pieces well.

- Google Business Profile APIs - posts, reviews, insights already exist.

What is hard (honestly): Google never guarantees #1 on Maps. Results depend on category, area, and starting point. We promise strong inputs (alive profile, fast replies, reviews, clear reporting) - not magic ranks.

What is easy now vs 5 years ago: one product can run content + chat + SEO + reports without a five-person agency.

5. How things work (simple benchmark)

Think of a normal month after setup (about 10 minutes to connect):

What	Before (typical)	With Qimma (target)
WhatsApp first reply	Hours / next day	Under ~30 seconds (AI)
Google posts	Rare / forgotten	Steady weekly cadence

Review replies	Slow or never	Drafted / helped quickly
Night enquiries	Often lost	Qualified and waiting for you
Owner's view	Guesswork	One scorecard: leads, ranks, pipeline

Weekly rhythm: agents check local keywords, improve SEO actions, publish content, and handle reviews. Maya runs all day on every new WhatsApp message.

Early proof style (examples, not a guarantee): studios seeing more profile views, a handful of qualified leads in the first month, and real projects coming from WhatsApp that used to go unanswered.

6. Bottom line

Problem Local businesses lose customers because Maps is weak and WhatsApp is slow.
